UNPACKING CHAPTER 4 ATOMIC STRUCTURE TEST A: KEY CONCEPTS AND ANSWERS

THIS SECTION PROVIDES A DETAILED BREAKDOWN OF THE TYPICAL CONCEPTS COVERED IN A CHAPTER 4 TEST ON ATOMIC STRUCTURE, ALONG WITH EXPLANATIONS THAT SERVE AS EFFECTIVE CHAPTER 4 ATOMIC STRUCTURE TEST A ANSWERS. WE WILL EXPLORE THE EVOLUTION OF ATOMIC THEORY, THE COMPONENTS OF AN ATOM, AND HOW THESE ELEMENTS DICTATE THE PROPERTIES OF MATTER. UNDERSTANDING THESE PRINCIPLES IS NOT JUST ABOUT PASSING A TEST; IT'S ABOUT BUILDING A STRONG FOUNDATION FOR ALL SUBSEQUENT SCIENTIFIC LEARNING.

THE EVOLUTION OF ATOMIC THEORY: FROM ANCIENT IDEAS TO MODERN MODELS

THE CONCEPT OF THE ATOM HAS A LONG AND FASCINATING HISTORY, EVOLVING SIGNIFICANTLY OVER CENTURIES. EARLY GREEK PHILOSOPHERS LIKE DEMOCRITUS PROPOSED THAT MATTER WAS COMPOSED OF INDIVISIBLE PARTICLES CALLED "ATOMOS." HOWEVER, IT WAS JOHN DALTON IN THE EARLY 19TH CENTURY WHO DEVELOPED THE FIRST MODERN ATOMIC THEORY. DALTON'S POSTULATES INCLUDED THE IDEA THAT ELEMENTS ARE COMPOSED OF TINY, INDIVISIBLE PARTICLES CALLED ATOMS, THAT ATOMS OF THE SAME ELEMENT ARE IDENTICAL, AND THAT ATOMS OF DIFFERENT ELEMENTS HAVE DIFFERENT MASSES. THIS MARKED A SIGNIFICANT SHIFT TOWARDS A SCIENTIFIC UNDERSTANDING OF THE ATOM.

J.J. THOMSON'S DISCOVERY OF THE ELECTRON IN 1897 REVOLUTIONIZED ATOMIC THEORY. HIS "PLUM PUDDING" MODEL PROPOSED THAT ATOMS WERE SPHERES OF POSITIVE CHARGE WITH NEGATIVELY CHARGED ELECTRONS EMBEDDED WITHIN THEM. ERNEST RUTHERFORD'S GOLD FOIL EXPERIMENT IN 1911 LED TO THE DISCOVERY OF THE NUCLEUS, A SMALL, DENSE, POSITIVELY CHARGED CENTER OF THE ATOM, AND HIS NUCLEAR MODEL DEPICTED ELECTRONS ORBITING THE NUCLEUS. NIELS BOHR FURTHER REFINED THIS MODEL BY PROPOSING THAT ELECTRONS ORBIT THE NUCLEUS IN SPECIFIC ENERGY LEVELS OR SHELLS. THE QUANTUM MECHANICAL MODEL, DEVELOPED BY ERWIN SCHRÖDINGER AND OTHERS, DESCRIBES ELECTRONS NOT AS PARTICLES IN FIXED ORBITS, BUT AS PROBABILITY DISTRIBUTIONS OR "ELECTRON CLOUDS" WITHIN SPECIFIC ENERGY LEVELS AND SUBLEVELS.

SUBATOMIC PARTICLES: PROTONS, NEUTRONS, AND ELECTRONS

AT THE HEART OF ATOMIC STRUCTURE ARE THE SUBATOMIC PARTICLES: PROTONS, NEUTRONS, AND ELECTRONS. PROTONS ARE POSITIVELY CHARGED PARTICLES FOUND IN THE NUCLEUS, EACH CARRYING A CHARGE OF $+1$ AND A MASS OF APPROXIMATELY 1 ATOMIC MASS UNIT (AMU). NEUTRONS, ALSO LOCATED IN THE NUCLEUS, HAVE NO CHARGE (NEUTRAL) AND A MASS VERY SIMILAR TO THAT OF PROTONS, ALSO AROUND 1 AMU. ELECTRONS ARE NEGATIVELY CHARGED PARTICLES WITH A CHARGE OF -1 AND A MASS SIGNIFICANTLY SMALLER THAN PROTONS AND NEUTRONS, APPROXIMATELY $1/1836$ AMU. THE NUMBER OF PROTONS IN AN ATOM'S NUCLEUS, KNOWN AS THE ATOMIC NUMBER, UNIQUELY IDENTIFIES AN ELEMENT. THE SUM OF PROTONS AND NEUTRONS IN THE NUCLEUS IS THE MASS NUMBER, WHICH DETERMINES THE ISOTOPE OF AN ELEMENT.

ATOMIC NUMBER AND MASS NUMBER: DEFINING ELEMENTS AND ISOTOPES

THE ATOMIC NUMBER (Z) IS A FUNDAMENTAL CHARACTERISTIC OF AN ELEMENT, DEFINED BY THE NUMBER OF PROTONS IN THE NUCLEUS OF AN ATOM OF THAT ELEMENT. FOR INSTANCE, ALL ATOMS WITH 6 PROTONS ARE CARBON ATOMS. THE ATOMIC NUMBER DICTATES THE ELEMENT'S POSITION ON THE PERIODIC TABLE AND DETERMINES ITS CHEMICAL PROPERTIES. THE MASS NUMBER (A), ON THE OTHER HAND, IS THE TOTAL NUMBER OF PROTONS AND NEUTRONS IN AN ATOM'S NUCLEUS. ISOTOPES ARE ATOMS OF THE SAME ELEMENT THAT HAVE THE SAME NUMBER OF PROTONS BUT DIFFERENT NUMBERS OF NEUTRONS. THIS DIFFERENCE IN NEUTRON COUNT LEADS TO VARIATIONS IN THEIR MASS NUMBERS. FOR EXAMPLE, CARBON-12 (6 PROTONS, 6 NEUTRONS) AND CARBON-14 (6 PROTONS, 8 NEUTRONS) ARE ISOTOPES OF CARBON.

ELECTRON CONFIGURATION: UNDERSTANDING ELECTRON ARRANGEMENT

ELECTRON CONFIGURATION DESCRIBES THE DISTRIBUTION OF ELECTRONS OF AN ATOM OR MOLECULE IN ATOMIC OR MOLECULAR ORBITALS. ELECTRONS OCCUPY SPECIFIC ENERGY LEVELS AND SUBLEVELS AROUND THE NUCLEUS. THESE ENERGY LEVELS ARE DESIGNATED BY PRINCIPAL QUANTUM NUMBERS ($n = 1, 2, 3, \dots$), AND WITHIN EACH ENERGY LEVEL ARE SUBLEVELS (s, p, d, f). THE 's' SUBLEVEL CAN HOLD A MAXIMUM OF 2 ELECTRONS, 'p' SUBLEVEL CAN HOLD 6, 'd' SUBLEVEL CAN HOLD 10, AND 'f' SUBLEVEL CAN HOLD 14. THE ARRANGEMENT OF ELECTRONS FOLLOWS SPECIFIC RULES, INCLUDING THE AUFBAU PRINCIPLE (ELECTRONS FILL ORBITALS OF LOWEST ENERGY FIRST), HUND'S RULE (ELECTRONS OCCUPY ORBITALS SINGLY BEFORE PAIRING UP), AND THE PAULI EXCLUSION PRINCIPLE (NO TWO ELECTRONS IN AN ATOM CAN HAVE THE SAME SET OF FOUR QUANTUM NUMBERS).

UNDERSTANDING ELECTRON CONFIGURATION IS KEY TO PREDICTING AN ELEMENT'S CHEMICAL BEHAVIOR, INCLUDING ITS BONDING PATTERNS AND REACTIVITY. FOR EXAMPLE, ELEMENTS WITH INCOMPLETE OUTER ELECTRON SHELLS TEND TO BE MORE REACTIVE AS THEY STRIVE TO ACHIEVE A STABLE ELECTRON CONFIGURATION, OFTEN RESEMBLING THAT OF NOBLE GASES.

IONS AND THEIR FORMATION: GAINING AND LOSING ELECTRONS

AN ION IS AN ATOM OR MOLECULE THAT HAS A NET ELECTRICAL CHARGE DUE TO THE LOSS OR GAIN OF ONE OR MORE ELECTRONS. WHEN AN ATOM LOSES ELECTRONS, IT BECOMES A POSITIVELY CHARGED ION, CALLED A CATION. CONVERSELY, WHEN AN ATOM GAINS ELECTRONS, IT BECOMES A NEGATIVELY CHARGED ION, CALLED AN ANION. THE CHARGE OF AN ION IS INDICATED BY A SUPERScript FOLLOWING THE ELEMENT SYMBOL. FOR INSTANCE, A SODIUM ATOM (Na) READILY LOSES ONE ELECTRON TO FORM A SODIUM ION (Na^+). A CHLORINE ATOM (Cl), ON THE OTHER HAND, READILY GAINS ONE ELECTRON TO FORM A CHLORIDE ION (Cl^-). THE FORMATION OF IONS IS A FUNDAMENTAL PROCESS IN IONIC BONDING, WHERE ELECTROSTATIC ATTRACTION BETWEEN OPPOSITELY CHARGED IONS HOLDS THE COMPOUND TOGETHER.

THE PERIODIC TABLE: ORGANIZING ATOMIC KNOWLEDGE

THE PERIODIC TABLE IS A TABULAR ARRANGEMENT OF THE CHEMICAL ELEMENTS, ORDERED BY THEIR ATOMIC NUMBER, ELECTRON CONFIGURATION, AND RECURRING CHEMICAL PROPERTIES. IT IS A POWERFUL TOOL FOR ORGANIZING AND UNDERSTANDING THE RELATIONSHIPS BETWEEN DIFFERENT ELEMENTS. ELEMENTS ARE ARRANGED IN ROWS CALLED PERIODS AND COLUMNS CALLED GROUPS. ELEMENTS WITHIN THE SAME GROUP GENERALLY HAVE SIMILAR CHEMICAL PROPERTIES BECAUSE THEY HAVE THE SAME NUMBER OF VALENCE ELECTRONS (ELECTRONS IN THE OUTERMOST ENERGY SHELL). PERIODS REPRESENT THE PRINCIPAL ENERGY LEVELS OCCUPIED BY ELECTRONS.

THE PERIODIC TABLE PROVIDES A WEALTH OF INFORMATION ABOUT EACH ELEMENT, INCLUDING ITS ATOMIC NUMBER, ATOMIC MASS, SYMBOL, AND OFTEN ITS STATE AT ROOM TEMPERATURE AND COMMON OXIDATION STATES. UNDERSTANDING HOW TO READ AND INTERPRET THE PERIODIC TABLE IS ESSENTIAL FOR COMPREHENDING ATOMIC STRUCTURE AND CHEMICAL BEHAVIOR.

NAVIGATING COMMON CHALLENGES IN ATOMIC STRUCTURE TESTS

MANY STUDENTS FIND CERTAIN ASPECTS OF ATOMIC STRUCTURE CHALLENGING. THIS SECTION AIMS TO PROVIDE CLARITY ON THESE OFTEN-CONFUSING TOPICS, OFFERING PRECISE CHAPTER 4 ATOMIC STRUCTURE TEST A ANSWERS AND EXPLANATIONS TO OVERCOME THESE HURDLES.

DISTINGUISHING BETWEEN ATOMIC NUMBER AND MASS NUMBER

A FREQUENT POINT OF CONFUSION IS THE DIFFERENCE BETWEEN THE ATOMIC NUMBER AND THE MASS NUMBER. AS PREVIOUSLY DISCUSSED, THE ATOMIC NUMBER SPECIFICALLY REFERS TO THE NUMBER OF PROTONS IN AN ATOM'S NUCLEUS. THIS NUMBER IS UNIQUE TO EACH ELEMENT AND DETERMINES ITS IDENTITY. THE MASS NUMBER, HOWEVER, IS THE SUM OF PROTONS AND NEUTRONS IN THE NUCLEUS. THEREFORE, ATOMS OF THE SAME ELEMENT CAN HAVE DIFFERENT MASS NUMBERS IF THEY HAVE DIFFERENT NUMBERS OF NEUTRONS – THESE ARE ISOTOPES.

FOR EXAMPLE, IF A TEST QUESTION STATES AN ATOM HAS 15 PROTONS AND 16 NEUTRONS, ITS ATOMIC NUMBER IS 15 (IDENTIFYING IT AS PHOSPHORUS, P), AND ITS MASS NUMBER IS $15 + 16 = 31$. IF ANOTHER ATOM OF PHOSPHORUS HAS 15 PROTONS AND 17 NEUTRONS, IT IS STILL PHOSPHORUS BUT HAS A MASS NUMBER OF 32.

DETERMINING THE NUMBER OF NEUTRONS FROM ATOMIC AND MASS NUMBERS

TO ACCURATELY DETERMINE THE NUMBER OF NEUTRONS IN AN ATOM, YOU NEED TO SUBTRACT THE ATOMIC NUMBER (NUMBER OF PROTONS) FROM THE MASS NUMBER (TOTAL PROTONS + NEUTRONS). THE FORMULA IS STRAIGHTFORWARD: $\text{NUMBER OF NEUTRONS} = \text{MASS NUMBER} - \text{ATOMIC NUMBER}$.

FOR INSTANCE, CONSIDER AN ISOTOPE OF POTASSIUM WITH A MASS NUMBER OF 39 AND AN ATOMIC NUMBER OF 19. THE NUMBER OF NEUTRONS WOULD BE $39 - 19 = 20$. IF YOU ARE GIVEN THE SYMBOL FOR AN ISOTOPE, SUCH AS ^{16}O , THE SUPERScript (16) IS THE MASS NUMBER AND THE ATOMIC NUMBER (WHICH IS IMPLIED BY OXYGEN, O, AND IS 8) CAN BE FOUND FROM THE PERIODIC TABLE. THEREFORE, THE NUMBER OF NEUTRONS IS $16 - 8 = 8$. MASTERING THIS CALCULATION IS FUNDAMENTAL FOR ACCURATELY DESCRIBING ISOTOPES.

PREDICTING ION FORMATION BASED ON ELECTRON CONFIGURATION

THE TENDENCY OF AN ATOM TO FORM AN ION IS DIRECTLY RELATED TO ITS DESIRE TO ACHIEVE A STABLE ELECTRON CONFIGURATION, TYPICALLY A FULL OUTERMOST ELECTRON SHELL. THIS OFTEN MEANS ACHIEVING THE ELECTRON CONFIGURATION OF A NOBLE GAS, WHICH HAVE VERY STABLE, FILLED VALENCE SHELLS.

FOR EXAMPLE, ELEMENTS IN GROUP 1 (ALKALI METALS) HAVE ONE VALENCE ELECTRON. THEY TEND TO LOSE THIS ELECTRON TO FORM +1 CATIONS. ELEMENTS IN GROUP 17 (HALOGENS) HAVE SEVEN VALENCE ELECTRONS AND TEND TO GAIN ONE ELECTRON TO FORM -1 ANIONS, COMPLETING THEIR OUTER SHELL WITH EIGHT ELECTRONS (OCTET RULE). UNDERSTANDING THESE TRENDS, AND HOW THEY RELATE TO THE NUMBER OF VALENCE ELECTRONS, ALLOWS FOR ACCURATE PREDICTION OF ION FORMATION. FOR INSTANCE, MAGNESIUM (Mg), WITH AN ELECTRON CONFIGURATION ENDING IN $3s^2$, READILY LOSES TWO ELECTRONS TO FORM Mg^{2+} .

APPLYING BOHR MODEL CONCEPTS IN PROBLEM-SOLVING

WHILE THE QUANTUM MECHANICAL MODEL IS THE CURRENT STANDARD, THE BOHR MODEL IS OFTEN USED IN INTRODUCTORY CHEMISTRY TO VISUALIZE ELECTRON ENERGY LEVELS. IN PROBLEMS RELATED TO THE BOHR MODEL, UNDERSTANDING THAT

ELECTRONS EXIST IN QUANTIZED ENERGY LEVELS OR SHELLS IS KEY. ELECTRONS CAN MOVE BETWEEN THESE LEVELS BY ABSORBING OR EMITTING SPECIFIC AMOUNTS OF ENERGY (PHOTONS). THE ENERGY OF THE EMITTED OR ABSORBED PHOTON CORRESPONDS TO THE DIFFERENCE IN ENERGY BETWEEN THE TWO LEVELS. FOR EXAMPLE, AN ELECTRON TRANSITIONING FROM A HIGHER ENERGY LEVEL TO A LOWER ONE WILL EMIT A PHOTON OF LIGHT.

UNDERSTANDING THE SIGNIFICANCE OF VALENCE ELECTRONS

VALENCE ELECTRONS ARE THE ELECTRONS IN THE OUTERMOST ENERGY SHELL OF AN ATOM. THEY ARE THE ELECTRONS INVOLVED IN CHEMICAL BONDING AND ARE RESPONSIBLE FOR AN ELEMENT'S CHEMICAL BEHAVIOR. THE NUMBER OF VALENCE ELECTRONS DETERMINES HOW AN ATOM WILL INTERACT WITH OTHER ATOMS TO FORM MOLECULES AND COMPOUNDS. FOR EXAMPLE, ELEMENTS IN THE SAME GROUP OF THE PERIODIC TABLE HAVE THE SAME NUMBER OF VALENCE ELECTRONS AND THUS EXHIBIT SIMILAR CHEMICAL PROPERTIES. THIS IS WHY ELEMENTS LIKE SODIUM, POTASSIUM, AND LITHIUM (ALL IN GROUP 1) ARE ALL HIGHLY REACTIVE METALS THAT FORM $+1$ IONS.

PRACTICE QUESTIONS AND EXPLANATIONS FOR CHAPTER 4 ATOMIC STRUCTURE

TO SOLIDIFY YOUR UNDERSTANDING AND PREPARE YOU FOR POTENTIAL TEST QUESTIONS, HERE ARE SOME PRACTICE SCENARIOS WITH DETAILED CHAPTER 4 ATOMIC STRUCTURE TEST A ANSWERS AND EXPLANATIONS.

SCENARIO 1: IDENTIFYING AN ELEMENT AND ITS ISOTOPES

AN ATOM HAS 17 PROTONS AND 18 NEUTRONS. WHAT ELEMENT IS IT, AND WHAT IS ITS MASS NUMBER? IF THIS ATOM LOSES ONE ELECTRON, WHAT ION DOES IT FORM?

ANSWER EXPLANATION:

- THE NUMBER OF PROTONS DETERMINES THE ELEMENT. AN ATOM WITH 17 PROTONS IS CHLORINE (CL), AS ITS ATOMIC NUMBER IS 17.
- THE MASS NUMBER IS THE SUM OF PROTONS AND NEUTRONS. SO, THE MASS NUMBER IS 17 PROTONS + 18 NEUTRONS = 35. THIS ISOTOPE IS CHLORINE-35 (^{35}Cl).
- WHEN A CHLORINE ATOM LOSES ONE ELECTRON, IT FORMS A POSITIVELY CHARGED ION BECAUSE IT NOW HAS MORE PROTONS (17) THAN ELECTRONS (16). THE ION FORMED IS Cl^{+} . HOWEVER, CHLORINE TYPICALLY GAINS AN ELECTRON TO ACHIEVE A STABLE CONFIGURATION, FORMING A Cl^{-} ION. THE QUESTION MIGHT BE TESTING UNDERSTANDING OF ION FORMATION RULES, WHERE LOSING AN ELECTRON WOULD BE UNUSUAL FOR CHLORINE. IN A TYPICAL SCENARIO, IT WOULD GAIN ONE ELECTRON TO BECOME Cl^{-} . IF THE QUESTION EXPLICITLY STATES "LOSES ONE ELECTRON", THEN Cl^{+} IS THE CORRECT ANSWER FOR THE ION FORMED, ALBEIT AN UNSTABLE ONE FOR CHLORINE.

SCENARIO 2: ELECTRON CONFIGURATION AND ION CHARGE

WRITE THE ELECTRON CONFIGURATION FOR CALCIUM (CA), WHICH HAS AN ATOMIC NUMBER OF 20. WHAT CHARGE WOULD A CALCIUM ION TYPICALLY HAVE?

ANSWER EXPLANATION:

- CALCIUM HAS 20 ELECTRONS. FOLLOWING THE AUFBAU PRINCIPLE, ELECTRONS FILL ORBITALS IN ORDER OF INCREASING ENERGY: 1s, 2s, 2p, 3s, 3p, 4s.
- THE ELECTRON CONFIGURATION FOR CALCIUM IS $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2$.
- CALCIUM HAS TWO VALENCE ELECTRONS IN THE 4s ORBITAL. TO ACHIEVE A STABLE ELECTRON CONFIGURATION LIKE THE PRECEDING NOBLE GAS (ARGON, WITH CONFIGURATION $1s^2 2s^2 2p^6 3s^2 3p^6$), CALCIUM WILL READILY LOSE THESE TWO VALENCE ELECTRONS.
- THEREFORE, A CALCIUM ION TYPICALLY HAS A +2 CHARGE, FORMING THE Ca^{2+} ION.

SCENARIO 3: IDENTIFYING SUBATOMIC PARTICLES IN AN ION

AN ION HAS A MASS NUMBER OF 31, AN ATOMIC NUMBER OF 15, AND A CHARGE OF -3. HOW MANY PROTONS, NEUTRONS, AND ELECTRONS DOES THIS ION HAVE?

ANSWER EXPLANATION:

- **PROTONS:** THE ATOMIC NUMBER DIRECTLY INDICATES THE NUMBER OF PROTONS. SO, THERE ARE 15 PROTONS. THIS IDENTIFIES THE ELEMENT AS PHOSPHORUS (P).
- **NEUTRONS:** THE NUMBER OF NEUTRONS IS THE MASS NUMBER MINUS THE ATOMIC NUMBER. SO, $NEUTRONS = 31 - 15 = 16$ NEUTRONS.
- **ELECTRONS:** THE CHARGE OF THE ION TELLS US THE DIFFERENCE BETWEEN PROTONS AND ELECTRONS. A CHARGE OF -3 MEANS THE ION HAS 3 MORE ELECTRONS THAN PROTONS. SINCE THERE ARE 15 PROTONS, THE ION HAS $15 + 3 = 18$ ELECTRONS.
- THEREFORE, THE ION HAS 15 PROTONS, 16 NEUTRONS, AND 18 ELECTRONS. THIS IS THE PHOSPHIDE ION (P^{3-}).

BY WORKING THROUGH THESE EXAMPLES AND UNDERSTANDING THE UNDERLYING PRINCIPLES, YOU WILL BE WELL-EQUIPPED TO TACKLE ANY QUESTION RELATED TO ATOMIC STRUCTURE ON YOUR TEST. THE KEY IS TO BREAK DOWN EACH PROBLEM INTO ITS FUNDAMENTAL COMPONENTS: PROTONS, NEUTRONS, ELECTRONS, AND THEIR ARRANGEMENT.

FREQUENTLY ASKED QUESTIONS

WHAT IS THE PRIMARY DIFFERENCE BETWEEN AN ATOM AND AN ION?

AN ATOM HAS A NEUTRAL CHARGE, MEANING IT HAS AN EQUAL NUMBER OF PROTONS AND ELECTRONS. AN ION IS AN ATOM THAT HAS GAINED OR LOST ELECTRONS, RESULTING IN A NET POSITIVE OR NEGATIVE CHARGE.

EXPLAIN THE CONCEPT OF ISOTOPES AND PROVIDE AN EXAMPLE.

ISOTOPES ARE ATOMS OF THE SAME ELEMENT THAT HAVE THE SAME NUMBER OF PROTONS BUT DIFFERENT NUMBERS OF NEUTRONS. FOR EXAMPLE, CARBON-12 AND CARBON-14 ARE ISOTOPES OF CARBON. BOTH HAVE 6 PROTONS, BUT CARBON-12 HAS 6 NEUTRONS, WHILE CARBON-14 HAS 8 NEUTRONS.

WHAT IS THE SIGNIFICANCE OF THE ATOMIC NUMBER AND MASS NUMBER?

THE ATOMIC NUMBER (Z) UNIQUELY IDENTIFIES AN ELEMENT AND REPRESENTS THE NUMBER OF PROTONS IN THE NUCLEUS. THE MASS NUMBER (A) REPRESENTS THE TOTAL NUMBER OF PROTONS AND NEUTRONS IN THE NUCLEUS.

DESCRIBE THE CHARGE AND LOCATION OF THE SUBATOMIC PARTICLES: PROTONS, NEUTRONS, AND ELECTRONS.

PROTONS HAVE A POSITIVE CHARGE AND ARE LOCATED IN THE NUCLEUS. NEUTRONS HAVE NO CHARGE (ARE NEUTRAL) AND ARE ALSO LOCATED IN THE NUCLEUS. ELECTRONS HAVE A NEGATIVE CHARGE AND ORBIT THE NUCLEUS IN SPECIFIC ENERGY LEVELS OR SHELLS.

HOW DO ELECTRON CONFIGURATIONS RELATE TO AN ELEMENT'S POSITION IN THE PERIODIC TABLE?

THE ELECTRON CONFIGURATION OF AN ATOM, PARTICULARLY THE NUMBER OF VALENCE ELECTRONS AND THE ENERGY LEVEL OF THE OUTERMOST ELECTRONS, DIRECTLY CORRESPONDS TO ITS PERIOD AND GROUP ON THE PERIODIC TABLE, PREDICTING ITS CHEMICAL BEHAVIOR.
